QUALITY ASSURANCE · PLAYWRIGHT E2E

Google Search to Playwright Docs

Sign in to Google, search for Playwright, open the official documentation, and verify its page title.

Test case: TC-GGL-PLW-001 | Priority: High | Type: End-to-end / UI | Status: Draft

Account security and automation note

Use an authorized Google test account only. Do not put a password, one-time code, recovery code, or session token in this document or in test source. Complete Google sign-in and any required verification through the approved manual setup, then use a protected Playwright storage-state file for the test. Do not attempt to bypass Google security checks.

1. Test case details

TEST CASE ID	TC-GGL-PLW-001
TITLE	Signed-in Google user can find the Playwright documentation and verify its page title
OBJECTIVE	Verify a signed-in user can search Google for Playwright, open the official Playwright documentation introduction page, and confirm the browser document title.
PRIORITY	High
TEST TYPE	End-to-end, UI, positive path
SUGGESTED AUTOMATION	Playwright Test with TypeScript and Page Object Model
PRECONDITIONS	Internet access is available; an authorized Google test account has an active authenticated session; approved browser state is prepared securely; Google Search is accessible.

TEST DATA	Search query: `Playwright official documentation`. No personal credentials are test data for this document.
TARGET DESTINATION	https://playwright.dev/docs/intro
EXPECTED DOCUMENT TITLE	**Installation | Playwright** (confirmed from the official docs page on 23 October 2026; revalidate if the site content changes).
STATUS	**Not executed**

2. Manual test steps

#	ACTION	EXPECTED RESULT
1	Open Google in a browser and sign in using the authorized test account. Complete any required verification through Google's normal sign-in flow.	Google displays the signed-in account indicator. No credentials or verification codes are recorded in test evidence.
2	In Google Search, enter `Playwright official documentation` and submit the search.	Search results are displayed for the Playwright documentation query.
3	Open the result whose destination is the official `playwright.dev` documentation page for Installation / Introduction (`/docs/intro`).	The browser opens the official Playwright documentation page, not an unrelated result or lookalike domain.
4	Read the browser tab/document title.	The document title is exactly `Installation | Playwright`.

3. Playwright automation example

The following is one focused Playwright Test suite. It assumes an authenticated session has been created beforehand through a permitted sign-in and stored at `playwright/.auth/google.json`. Keep that file out of source control and use a dedicated test account; storage state contains sensitive session data.

```
import { expect, Page, test } from '@playwright/test';

test.use({ storageState: 'playwright/.auth/google.json' });

class GoogleSearchPage {
  constructor(private readonly page: Page) {}

  async open(): Promise<void> {
    await this.page.goto('https://www.google.com/');
  }

  async expectSignedIn(): Promise<void> {
    await expect(
      this.page.locator('[aria-label^="Google Account"]')
    ).toBeVisible();
  }

  async search(query: string): Promise<void> {
    const searchBox = this.page.getByRole('combobox', { name: /search/i });
    await searchBox.fill(query);
    await searchBox.press('Enter');
  }

  async openOfficialPlaywrightDocs(): Promise<void> {
    const result = this.page.locator(
      'a[href*="playwright.dev/docs/intro"]'
    ).first();
    await expect(result).toBeVisible();
    await result.click();
  }
}

class PlaywrightDocsPage {
  constructor(private readonly page: Page) {}

  async expectOfficialIntroductionPage(): Promise<void> {
    await expect(this.page).toHaveURL(
      /^https:\/\/playwright\.dev\/docs\/intro(?:[?#].*)?$/
    );
    await expect(this.page).toHaveTitle('Installation | Playwright');
    await expect(
      this.page.getByRole('heading', { name: 'Installation', level: 1 })
    ).toBeVisible();
  }
}

test.describe('Google search to official Playwright documentation', () => {
  test('TC-GGL-PLW-001: signed-in user finds Playwright docs and verifies the titl
    async ({ page }) => {
      const google = new GoogleSearchPage(page);
      const docs = new PlaywrightDocsPage(page);
```

```
      await google.open();
      await google.expectSignedIn();
      await google.search('Playwright official documentation');
      await google.openOfficialPlaywrightDocs();
      await docs.expectOfficialIntroductionPage();
    }
  );
});
```

Automation setup

Provision the authenticated state locally using the approved account and sign-in process. Protect it as a secret, exclude it from version control, and periodically refresh it when the session expires. Google can change its UI, regional behavior, and search-result markup; review the locators if the page changes. Do not disable account protections to make this test pass.

The title assertion is the primary acceptance check. The URL and page heading assertions additionally confirm that the opened result is the intended official documentation page.

4. Pass / fail criteria

Pass

The signed-in account indicator is visible, the search is submitted, the official documentation introduction page opens at the expected URL, and its document title equals `Installation | Playwright`.

Fail / blocked

Fail: The wrong destination opens, the title differs, or the required page cannot be located after a valid search.

Blocked: The authorized session is unavailable/expired, Google requires a human security challenge, or internet access is unavailable. Resolve through the approved sign-in flow; do not bypass security controls.

5. Reference

- Official Playwright documentation page used as the title oracle: https://playwright.dev/docs/intro
- Document title checked: `Installation | Playwright`.

- Title verified against the official page on 23 October 2026; re-check the oracle before future executions because website titles can change.
